Experiment 4: KNN Classification Using Confusion Matrix and Classification Report

Aim:

To implement a K-Nearest Neighbors (KNN) classifier and evaluate its performance using a confusion matrix and classification report.

Algorithm:

1. Import the required libraries.
2. Load the dataset and separate the input features and target variable.
3. Split the dataset into training and testing sets.
4. Create a KNN classifier.
5. Train the classifier using the training data.
6. Predict the target values for the test data.
7. Generate the confusion matrix using `confusion_matrix()`.
8. Generate the classification report using `classification_report()` to obtain precision, recall, and F1-score.

Result:

Thus, the KNN classifier was implemented successfully, and its performance was evaluated using a confusion matrix, precision, recall, and F1-score.
