Experiment 5: Support Vector Machine (SVM)

Aim:

To implement a Support Vector Machine (SVM) classifier for classification of the given dataset.

Algorithm:

1. Import the required libraries.
2. Load the dataset and separate the input features and target variable.
3. Split the dataset into training and testing sets.
4. Create an SVM classifier using `SVC()`.
5. Train the model using the training data.
6. Predict the target values for the test data.
7. Evaluate the model's classification performance.

Result:

Thus, the Support Vector Machine classifier was implemented successfully and used to classify the given dataset.
