Experiment 8: Random Forest Classifier

Aim:

To implement a Random Forest Classifier to predict the target variable using the given dataset.

Algorithm:

1. Import the required libraries.
2. Load the dataset and separate the input features and target variable.
3. Split the dataset into training and testing sets.
4. Create a Random Forest Classifier using `RandomForestClassifier()`.
5. Train the model using the training data.
6. Predict the target values for the test data.
7. Evaluate the model using suitable classification metrics.

Result:

Thus, the Random Forest Classifier was implemented successfully and evaluated to measure its classification performance.
